

Considerations for Selecting RTCP Extended Report (XR) Metrics for the RTCWEB Statistics API

draft-ietf-xrblock-rtcweb-rtcp-xr-
metrics-00

Status

- WG item
 - No technical changes in -00 version

Open Issue

- Registry
 - Originally referred to *draft-alvestrand-stats-registry*, that is not being pursued as that work has moved to W3C
- Open Issue:
 - Use IPPM's new registry
 - Make an XRBLOCK stats identifier registry
- There is a need for “name identifiers” (e.g. `bytesDiscarded`), will be exposed in the W3C API
 - IPPM registry allows a single identifier to have different measurement interval and the identifier is a number.
 - An XRBLOCK identifier registry would have different identifiers for these measurement intervals.

Next Steps

- Anything missing?
 - Metrics?
